

Dream Big-Real Estate Management System

A Mini Project Report submitted to

**DEPARTMENT
OF
COMPUTER SCIENCE AND SYSTEMS ENGINEERING**

Submitted by

M Abdul Rehaman

(21121A1566)

A Sashidhar

(21121A1503)

G. Hussain

(21121A1530)

Under the Guidance of

Mr. P. Yogendra Prasad

Assistant Professor

Department of Computer Science and Systems Engineering

Sree Vidyanikethan Engineering College (Autonomous)

Sree Sainath Nagar, Tirupati - 517 102

(2023-2024)

SREE VIDYANIKETHAN ENGINEERING COLLEGE
(AUTONOMOUS)
Sree Sainath Nagar, Tirupati

DEPARTMENT OF COMPUTER SCIENCE AND SYSTEMS ENGINEERING

CERTIFICATE

This is to certify that the mini project report entitled

“Dream Big- Real Estate Management System”

is the Bonafide work done by

M Abdul Rehaman

(21121A1566)

A Sashidhar

(21121A1503)

G. Hussain

(21121A1530)

in the Department of **Computer Science and Systems Engineering**, and submitted to Jawaharlal Nehru Technological University Anantapur, Ananthapuramu in partial fulfillment of the requirements for the award of the degree of Bachelor of Technology in Computer Science and Systems Engineering during the academic year 2023-2024. This work has been carried out under my supervision. The results of this mini project work have not been submitted to any university for the award of any degree or diploma.

Guide:

Head:

Mr. P. Yogendra Prasad
Assistant Professor
Dept. of CSSE

Dr. K. Ramani
Professor & Head
Dept. of CSSE

EXTERNAL EXAMINER

DEPARTMENT OF COMPUTER SCIENCE AND SYSTEMS ENGINEERING

VISION AND MISSION

VISION

- **To become a Centre of excellence in Computer Sciences and Systems Engineering through Teaching, Training and Innovation to produce high quality engineering professionals who can solve the growing complex problems of the society and industry.**

MISSION

- **Established with cause of development of technical education in advanced Computers Sciences and Systems Engineering with applications to systems there by serving the society and Nation.**
- **Transfer of knowledge through contemporary curriculum and fostering faculty and student development.**
- **Create keen interest for research and innovation among students and faculty by understanding the needs of the society and industry.**
- **Skill Development among diversity of students in technical in technical domains and profession for development of systems and processes to meet the demands of the industry and research.**
- **Imbibing values and ethics in students for prospective and promising engineering and develop a sense of respect for all.**

Program Educational Objectives (PEO's)

After few years of graduation, the graduates of B.Tech (CSSE) will:

1. Demonstrate competencies in the Computer Science domain and Management with an ability to comprehend, analyze, design and create software systems for pursuing advanced studies in the areas of interest.
2. Evolve as entrepreneurs or be employed by acquiring required skill sets for developing computer systems and solutions in multi-disciplinary areas.
3. Exhibit progression and professional skill development in Computer programming and systems development with ethical attitude through life-long learning.

Program Specific Outcomes (PSO's)

On successful completion of the Program, the graduates of B. Tech (CSSE) program will be able to:

- PSO1** Employ Systems Approach to model the solutions for real life problems, design and develop software systems by applying Modern Tools.
- PSO2** Develop solutions using novel algorithms in High Performance Computing and Data Science.
- PSO3** Use emerging technologies for providing security and privacy to design, deploy and manage network systems.

Program Outcomes (PO's)

1. Apply the knowledge of mathematics, science, engineering fundamentals, and an engineering specialization to the solution of complex engineering problems (**Engineering knowledge**).
2. Identify, formulate, review research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences (**Problem analysis**).
3. Design solutions for complex engineering problems and design system components or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations (**Design/development of solutions**).
4. Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions (**Conduct investigations of complex problems**).
5. Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and modeling to complex engineering activities with an understanding of the limitations (**Modern tool usage**).
6. Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional engineering practice (**The engineer and society**).
7. Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development (**Environment and sustainability**).

8. Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice (**Ethics**).

9. Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings (**Individual and team work**).

10. Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions (**Communication**).

11. Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments (**Project management and finance**).

12. Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change (**Life-long learning**).

DECLARATION

We hereby declare that this project report titled “**Dream Big- Real Estate Management System**” is a genuine work carried out by us, in **B.Tech (*Computer Science and Systems Engineering*)** degree course of **Jawaharlal Nehru Technological University Anantapur** and has not been submitted to any other course or University for the award of any degree by us.

We declare that this written submission represents our ideas in our own words and where others' ideas or words have been included, we have adequately cited and referenced the original sources. We also declare that we have adhered to all principles of academic honesty and integrity and have not misrepresented or fabricated or falsified any idea / data / fact / source in our submission. We understand that any violation of the above will cause for disciplinary action by the Institute and can also evoke penal action from the sources which have thus not been properly cited or from whom proper permission has not been taken when needed.

ABSTRACT

The Real Estate Management System (REMS) is a comprehensive web-based application designed to streamline the management and operation of real estate properties. This system utilizes HTML, CSS, and JavaScript to create an intuitive user interface accessible from any web browser. REMS offers a range of functionalities tailored to meet the needs of property managers, landlords, and tenants, facilitating efficient property management processes. One of the key features of REMS is its ability to automate various aspects of property management, including property listing, tenant screening, lease management, and maintenance requests. Through a user-friendly interface, property managers can easily add, edit, and update property listings with detailed descriptions, images, and rental terms. Additionally, REMS incorporates advanced search filters, enabling users to quickly find properties that meet their specific criteria, such as location, price range, and amenities. Moreover, REMS enhances communication and collaboration among stakeholders by providing built-in messaging and notification functionalities. Tenants can submit maintenance requests, communicate with property managers, and track the status of their requests in real-time. Property managers, on the other hand, can efficiently respond to inquiries, manage lease agreements, and schedule property viewings through the platform. Overall, REMS offers a centralized platform that simplifies real estate management tasks, improves transparency, and enhances the overall experience for property owners, managers, and tenants alike.

Keywords: web based application, User interface, HTML, JAVASCRIPT, PHP, Property Listing.

CHAPTER- 1

INTRODUCTION

1.1 Introduction:

The Real Estate Management System (REMS) is a pivotal tool in the modern real estate landscape, providing a digital platform to streamline and optimize the management of properties. As the real estate industry continues to evolve, the demand for efficient and effective management solutions has become increasingly evident. REMS addresses this need by offering a comprehensive web-based application built using HTML, CSS, and JavaScript, aimed at simplifying the complex processes involved in property management.

In today's fast-paced world, property managers, landlords, and tenants alike seek convenience, transparency, and efficiency in managing and accessing real estate assets. Traditional methods of property management often involve cumbersome paperwork, manual data entry, and fragmented communication channels, leading to inefficiencies and errors.

At its core, REMS is designed to enhance the entire lifecycle of property management, from listing and leasing to maintenance and communication. Property managers can effortlessly create and update property listings, screen potential tenants, manage lease agreements, and handle maintenance requests, all within a user-friendly interface accessible from any web browser. Tenants benefit from improved communication channels, streamlined maintenance processes, and greater transparency into their rental agreements.

In this era of digital transformation, the adoption of REMS represents a fundamental shift towards modernizing and optimizing real estate management practices. By leveraging technology to streamline workflows, enhance communication, and improve transparency, REMS empowers stakeholders to make informed decisions, maximize efficiency, and ultimately drive greater value from their real estate investments. As we delve deeper into the functionalities and benefits of REMS, it becomes clear that it is not just a software solution but a catalyst for transformation within the real estate industry.

1.2 Problem Statement:

The traditional methods of managing real estate properties are plagued with inefficiencies, lack of transparency, and fragmented communication channels, leading to a myriad of challenges for property managers, landlords, and tenants. Paper-based documentation, manual data entry, and reliance on outdated systems contribute to errors, delays, and suboptimal decision-making processes. Additionally, the lack of centralized platforms exacerbates the difficulty in accessing crucial information and coordinating tasks among stakeholders.

Moreover, the absence of automated processes in property management results in a significant time and resource drain for property managers. Tasks such as property listing, tenant screening, lease management, and maintenance requests are often handled manually, leading to inefficiencies, increased operational costs, and decreased productivity. Furthermore, the inability to effectively communicate and collaborate in real-time exacerbates the challenges faced by stakeholders, leading to misunderstandings, delays in addressing issues, and ultimately, dissatisfaction among tenants and property owners.

In light of these challenges, there is a pressing need for a comprehensive real estate management solution that leverages modern technology to streamline processes, enhance communication, and improve transparency. Such a solution should provide a centralized platform accessible from any web browser, offering functionalities such as automated property listing, tenant screening, lease management, maintenance request handling, and robust communication channels.

1.3 Objectives:

The objective of this project is to develop a comprehensive Real Estate Management System (REMS) using HTML, CSS, and JavaScript, with the aim of streamlining property management processes, enhancing communication and collaboration among stakeholders, improving accessibility and transparency of property-related information, and optimizing decision-making through data-driven insights.

- Streamline Property Management Process .
- Enhance Communication.
- Provide comprehensive details.
- Optimize Decision Making.
- Ensure responsive design.
- Improve Accessibility and Transparency.

1.4 Limitations:

- Technical Constraints.
- Data security and privacy concerns.
- Regulatory Compliance

CHAPTER – 2

METHODOLOGY

Building a real estate management system with HTML alone is restrictive. While HTML excels at presenting information, it lacks the power for real functionality. To create a comprehensive system, consider a multi-layered approach. Start by defining user needs and features, then choose a development method. A database-driven system with HTML, CSS, JavaScript, and server-side scripting like PHP offers robust data storage, user management, and interactivity. This approach allows you to craft a user-friendly interface with functionalities like property search, maintenance requests, and rent collection.

It remains a vital first step. Think of HTML as the skeleton of your system, providing the structure for users to navigate and view information. The magic comes alive with additional layers. CSS adds the visual flair, while JavaScript injects interactivity. But the true power lies in the server-side. Here, scripting languages like PHP and a database like MySQL become the muscles, enabling features like user logins, complex searches, and data manipulation. This combined approach lets you build a real estate management system that is both informative and functionally powerful.

CHAPTER – 3

SYSTEM DESIGN

4.1 Requirements:

The user should have the appropriate version of windows.

- The system should have up to 1 GB ram minimum requirement for the application.
- Internet Connectivity is a must for this purpose.

4.2 System Design:

The website has a user-friendly and well-designed design to ensure a smooth browsing experience. The following sections describe the main content and structure of the site:

HOME PAGE: The home page promotes the site and displays attractive banners with images of famous tourists from many states. It also provides a search bar and menu for easy access to various sections.

Property Listing Page: Users can search and browse through available properties based on criteria such as location, price range, property type, etc. Listings may include photos, descriptions, prices, and contact information.

User Dashboard: Registered users have access to a personalized dashboard where they can manage their saved properties, property alerts, messages, appointments, and account settings.

Property Details Page: When a user clicks on a specific property listing, they are taken to a detailed page with more information about that property. This may include additional photos, floor plans, amenities, property history, and virtual tours.

4.3 Technologies used:

The website is built using front-end technologies to create an engaging and dynamic user interface. The key technologies employed in the development of this website are:

HTML5: The website structure and content are created using HTML5, ensuring semantic markup and proper organization of information.

CSS3: CSS3 is used for styling and visual presentation of the website, including layout design, color schemes, typography, and responsive elements.

JAVASCRIPT: JavaScript is utilized to implement interactive features such as search functionality, user reviews, and dynamic content loading

CHAPTER - 4

IMPLEMENTATION

Implementing a real estate management system using HTML involves creating a structured and visually appealing interface to showcase property listings, facilitate user interactions, and manage system functionalities. The implementation process typically includes several key steps and components.

Firstly, the user interface (UI) design phase focuses on creating wireframes, mockups, and user flow diagrams to plan the layout, navigation, and overall look and feel of the system. HTML, along with CSS for styling and possibly JavaScript for interactivity, is used to build responsive and intuitive web pages. This includes designing pages for property listings, property details, user registration/login, user dashboard, agent profiles, contact forms, and informational pages such as FAQs and about us.

After this front-end development phase, which uses HTML5, CSS3, JavaScript, and php to implement the website's visual content, interactive features, and user interface. The collected data was organized in the database. The database will create a relationship between information organizations to enable the retrieval and display of information on the website. We performed quality testing and quality assurance to ensure website functionality, functionality and browser compatibility.

Throughout the implementation process, thorough testing is essential to ensure system reliability, performance, and security. Unit testing, integration testing, and end-to-end testing methodologies are applied to validate system components, data integrity, user workflows, and cross-browser compatibility.

Overall, implementing a real estate management system using HTML involves a coordinated effort across UI design, frontend development, backend logic, database management, API integrations, and testing phases to create a seamless and feature-rich platform for property stakeholders and users. Regular updates, feedback collection, and continuous improvement cycles further enhance the system's usability and effectiveness in the real estate domain.

CHAPTER-5

PROPOSED SYSTEM ARCHITECTURE

The proposed system architecture for our real estate management system is designed to be scalable, secure, and efficient, leveraging modern technologies to meet the demands of a dynamic real estate market. At its core, the system architecture consists of multiple layers that work seamlessly together to deliver a robust and user-friendly experience.

Starting with the presentation layer, we utilize HTML, CSS, and JavaScript to create responsive and interactive user interfaces across various devices, ensuring a consistent and engaging user experience. The front-end interfaces connect to the application layer, which is built using server-side technologies such as Node.js or Python with frameworks like Django or Express.js. This layer handles user requests, business logic, and data processing, interfacing with the database layer for data retrieval and storage.

The database layer is implemented using a relational database management system (RDBMS) such as MySQL or PostgreSQL to store structured data related to properties, users, transactions, and system configurations. Advanced indexing and query optimization techniques are employed to ensure fast and efficient data retrieval, especially during property searches and listing operations.

For security and authentication purposes, the system incorporates robust authentication mechanisms such as OAuth2 or JSON Web Tokens (JWT) to manage user sessions securely. Role-based access control (RBAC) is implemented to enforce authorization rules based on user roles, ensuring that sensitive operations and data are accessible only to authorized personnel.

Monitoring and logging tools such as Prometheus, Grafana, and ELK stack (Elasticsearch, Logstash, Kibana) are integrated into the architecture for real-time performance monitoring, error tracking, and proactive system maintenance. Automated testing frameworks and continuous integration/continuous deployment (CI/CD) pipelines are employed to ensure code quality, reliability, and rapid deployment of system updates and enhancements.

Overall, this proposed system architecture lays a solid foundation for building a scalable, secure, and feature-rich real estate management system that can adapt to evolving market trends, user needs, and technological advancements. Regular performance audits, security assessments, and feedback loops will be instrumental in refining and optimizing the system architecture over time.

## 6.2 Result:

### i. Home Page:

This page is the website home page, where you can find about all the choices and services offered in our platform and explore different locations of India, categorized on a state level basis.

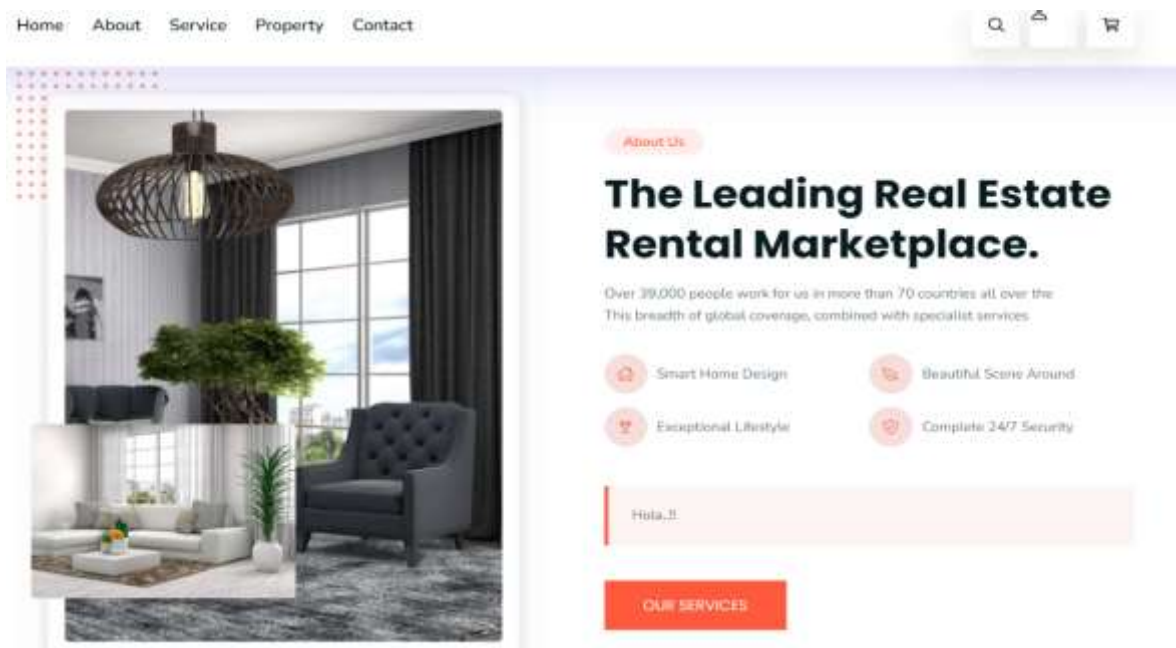

### ii. Login page:

This is the page where a user can find all the states of India and can browse each state based on their choice.

### iii. About page:

This is the page where an existing user can log in and view all the features of the website.

### iv. Registration Page:

If a user is new to the webpage, they can register here and get information about any new information that we post and receive newsletters via mail.

The image shows a registration form on a blue background. The form is titled 'Registration' and has fields for Name, Email, Phone Number, Address, Location, and Password. There is a 'Register' button at the bottom. The background features a large blue sphere and a smaller blue sphere.

## v. Property Listing page:

Once the user chooses a state of their choice, they can get an overview of the top tourist attractions in that state.

## **CHAPTER-7**

### **CONCLUSION AND FUTURE WORK**

#### **7.1 Conclusion:**

In conclusion, our real estate management system built with HTML offers a seamless and intuitive platform for users to explore, list, and manage properties. Through responsive design and user-friendly interfaces, we provide a comprehensive experience that includes property listings, detailed property information, user registration and login capabilities, personalized user dashboards, agent profiles, informative content such as blogs and FAQs, and robust contact and support channels. By leveraging HTML's versatility and compatibility, we ensure a smooth browsing experience across devices, making property transactions and management efficient and accessible for all users in the real estate ecosystem.

#### **7.2 Future Work:**

As we look to the future, several avenues for further improvement and expansion of our real estate management system using HTML present themselves. One area of focus could be enhancing the user experience through advanced search functionalities, such as implementing AI-driven search algorithms that offer personalized property recommendations based on user preferences and behavior patterns. Integrating virtual reality (VR) and augmented reality (AR) technologies into property listings can also provide immersive experiences for potential buyers, allowing them to virtually tour properties from anywhere in the world. Additionally, incorporating blockchain technology for secure and transparent property transactions, smart contracts for automated agreements, and digital escrow services can streamline and secure the buying and selling processes further. Enhancing data analytics capabilities to provide real-time market insights, trend analysis, and predictive modeling can empower users with valuable information for informed decision-making. Moreover, expanding our platform's reach through mobile app development and localization features can cater to a wider audience globally, tapping into emerging real estate markets and diverse demographics. Continuous user feedback and usability testing will be crucial in iteratively refining and optimizing the system to meet evolving industry standards and user expectations, ensuring our real estate management system remains at the forefront of innovation and excellence.
